but...

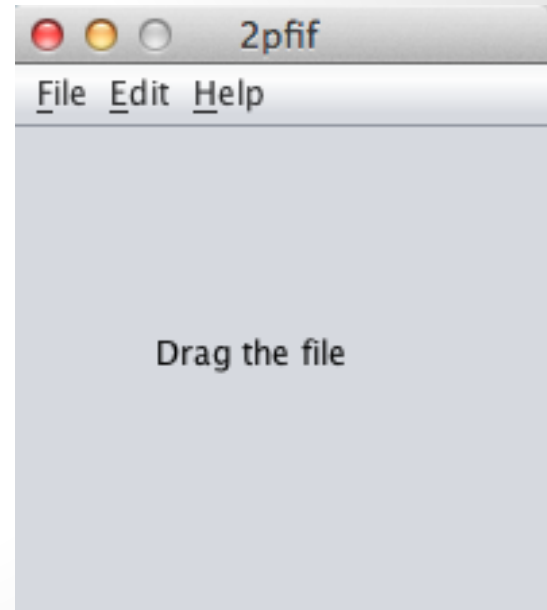

Data is in varying formats

- Organizations already have lists of missing persons (spreadsheets, databases, cvs)
- Person Finder Interchange Format is XML and has many different fields
- Converting these lists in PFI Format is a painful problem for organizations

Person Finder upload tool

- Simple and small stand-alone tool
- Converts data in CSV files to PFIF
- Uploads PFIF entries directly on a Google Person Finder server

Simple flow

1. Download the tool and set the appkey
2. Export the list data in CSV format
3. Define a list of PFIF keys mapped to the column of the CVS file
4. Drag and drop the file in the tool

" I'm proud of you! "

Thank you :)

RHOK Trento rocks!
